Department of Information and Communication Engineering

Course Code: ICE-3206

Course Title: Digital Communication Sessional

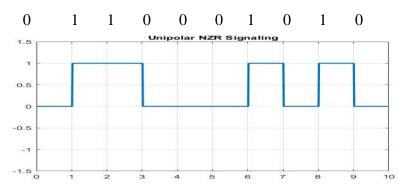

1. Unipolar NRZ Signaling:

In this line code, symbol 1 is represented by transmitting a pulse of amplitude A/voltage V for the duration of the symbol, and symbol 0 is represented by switching off the pulse, as illustrated in the following figure:

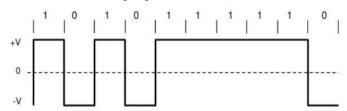

```
% Unipolar Non Return to Zero Line Coding
clc;
clear all;
close all;
                                % Number of bits
N=10;
n=randi([0,1],1,N)
                                %Random bit generation
% Mapping Function
for m=1:N
  if n(m) == 1
        nn(m)=1;
  else
        nn(m)=0;
  end
end
% Signal Shaping
i=1:
t=0:0.01:length(n);
                                %100 Times duration set up for a single binary bit
                        %Indexing set-up for time duration
for j=1:length(t)
  if t(j) <= i
                                %Binary input data index Check-up Condition
       y(j)=nn(i);
                                % Assign value from the mapping function
  else
        y(j)=nn(i);
                                %Binary input data index increment
        i=i+1;
  end
end
plot(t,y, 'linewidth',2);
axis([0,N,-1.5,1.5]);
                                %Axis set-up
grid on;
title("Unipolar NZR Signaling");
```

Binary Data: n =

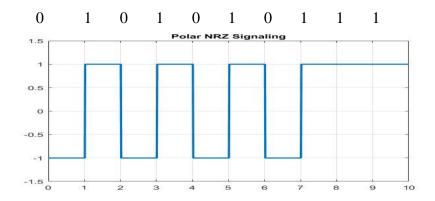

2. Polar NRZ Signaling:

In this line code, symbols 1 and 0 are represented by transmitting pulses of amplitudes +A and -A, respectively, as illustrated in the following figure:

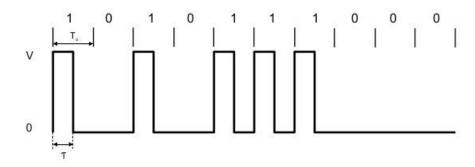

```
% Polar Non Return to Zero Line Coding
clc;
clear all;
close all;
N=10;
                               % Number of bits
n=randi([0,1],1,N)
                               %Random bit generation
%Mapping Function
for m=1:N
  if n(m) == 1
       nn(m)=1;
  else
       nn(m)=-1;
  end
end
%Signal Shaping
i=1;
t=0:0.01:length(n);
                               % 100 Times duration set up for a single binary bit
for j=1:length(t)
                               %Indexing set-up for time duration
                               % Binary input data index Check-up Condition
  if t(j) \le i
       y(j)=nn(i);
                               % Assign value from the mapping function
  else
       y(j)=nn(i);
       i=i+1;
                               %Binary input data index increment
  end
end
plot(t,y, 'linewidth',2);
axis([0,N,-1.5,1.5]);
                               %Axis set-up
grid on;
title("Polar NZR Signaling");
```

Binary Data: n =

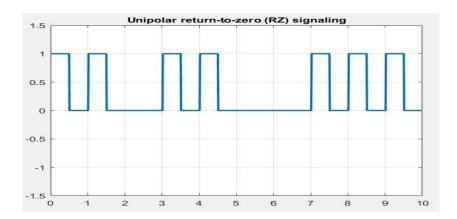

3. <u>Unipolar RZ Signaling:</u>

In this line code, symbol 1 is represented by a rectangular pulse of amplitude A/ voltage v for half-symbol width, and symbol 0 is represented by transmitting no pulse, as illustrated in figure:

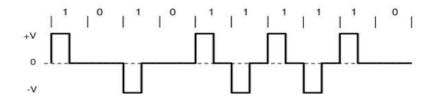

```
%RZ Unipolar line coding
clc;
clear all;
close all;
                                 % Number of bits
N=10;
n=randi([0,1],1,N)
                                 %Random bit generation
%RZ Pulse Shaping
i=1;
a=0;
                                 % Initial value for the first half cycle
b=0.5;
                                 %Initial value for the second half cycle
t=0:0.01:length(n);
for j=1:length(t)
                                 %Condition for the first half cycle
  if t(j) >= a && t(j) <= b
                                 % Assign first 50 values for
     y(j)=n(i);
                                 %Condition for the Second half cycle
  elseif t(j)>b && t(j)<=i
                                 %Set all values 0 for the second half cycle
     y(j)=0;
  else
                                 %Binary input data index increment
       i=i+1;
                                 % Initial value for the first half cycle increment
       a=a+1;
                                 % Initial value for the second half cycle increment
       b=b+1;
  end
end
plot(t,y,'lineWidth', 2);
                                 %Linewidth 2 for clear visualization
axis([0,N,-1.5,1.5]);
                                 %Axis set-up
grid on;
title('Unipolar return-to-zero (RZ) signaling');
```

4. Bipolar RZ Signaling:

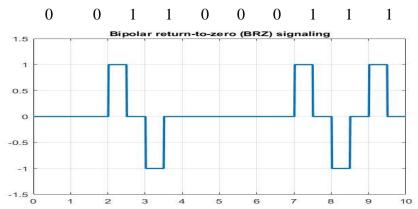

This line code uses three amplitude levels as indicated in the following figure. Specifically, positive and negative pulses of equal amplitude (i.e., +A and -A) are used alternatively for symbol 1, with each pulse having a half-symbol width; no pulse is always used for symbol 0.

```
%Bipolar Return to Zero Signaling
clc;
clear all;
close all;
N=10;
                  %Number of bits
n=randi([0,1],1,N)
                      %Random bit generation
%Binary to Bipolar Conversion
f=1;
for m=1:N
  if n(m) == 1
    if f==1
       nn(m)=1;
       f=-1;
    else
       nn(m)=-1;
       f=1;
    end
  else
     nn(m)=0;
  end
end
%Bipolar RZ Pulse Shaping
i=1;
                     % Initial value for the first half cycle
a=0;
b=0.5;
                      % Initial value for the second half cycle
```

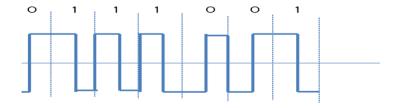

```
t=0:0.01:length(n);
for j=1:length(t)
if t(j) >= a \&\& t(j) <= b
                          %Condition for the first half cycle
                                  % Assign first 50 values for
               y(j)=nn(i);
elseif t(j)>b && t(j)<=i %Condition for the Second half cycle
                                 %Set all values 0 for the second half cycle
               y(j)=0;
else
                      %Binary input data index increment
       i=i+1;
                               % Initial value for the first half cycle increment
               a=a+1;
                        %Initial value for the second half cycle increment
       b=b+1;
end
end
plot(t,y,'lineWidth', 2);
                            %Linewidth 2 for clear visualization
axis([0,N,-1.5,1.5]);
                            %Axis set-up
grid on;
title('Bipolar return-to-zero (BRZ) signaling');
```

Binary Data: n =

5. Split-Phase (Manchester Code):

In this method of signaling, illustrated in the figure, symbol 1 is represented by a positive pulse of amplitude A followed by a negative pulse of amplitude – A, with both pulses being half-symbol wide. For symbol 0, the polarities of these two pulses are reserved.

```
% Split Phase-Manchester Coding
clc;
clear all;
close all;
N=10;  % Number of bits
n=randi([0,1],1,N)  % Random bit generation
% Binary to Manchester Conversion
nnn=[];
for m=1:N
    if n(m)==1
        nn=[1-1];
```

```
else
    nn=[-1 1];
  end
  nnn=[nnn nn];
end
nnn
%Manchester Coding Pulse Shaping
i=1;
1=0.5;
t=0:0.01:length(n);
for j=1:length(t)
                        %Condition for the first half cycle
  if t(j) <= l
                          %Assign first 50 values for
    y(j)=nnn(i);
  else
    y(j)=nnn(i);
    i=i+1;
    1=1+0.5;
  end
end
plot(t,y,'lineWidth', 2);
                             %Linewidth 2 for clear visualization
axis([0,N,-1.5,1.5]);
                             %Axis set-up
grid on;
title('Manchester Coding');
```
